Theorems

Lectured by W. T. Gowers

Lent 2015

Limits and convergence

Sequences and series in \mathbb{R} and \mathbb{C} . Sums, products and quotients. Absolute convergence; absolute convergence implies convergence. The Bolzano-Weierstrass theorem and applications (the General Principle of Convergence). Comparison and ratio tests, alternating series test. [6]

Continuity

Continuity of real- and complex-valued functions defined on subsets of \mathbb{R} and \mathbb{C} . The intermediate value theorem. A continuous function on a closed bounded interval is bounded and attains its bounds. [3]

Differentiability

Differentiability of functions from \mathbb{R} to \mathbb{R} . Derivative of sums and products. The chain rule. Derivative of the inverse function. Rolle's theorem; the mean value theorem. One-dimensional version of the inverse function theorem. Taylor's theorem from \mathbb{R} to \mathbb{R} ; Lagrange's form of the remainder. Complex differentiation. [5]

Power series

Complex power series and radius of convergence. Exponential, trigonometric and hyperbolic functions, and relations between them. *Direct proof of the differentiability of a power series within its circle of convergence*. [4]

Integration

Definition and basic properties of the Riemann integral. A non-integrable function. Integrability of monotonic functions. Integrability of piecewise-continuous functions. The fundamental theorem of calculus. Differentiation of indefinite integrals. Integration by parts. The integral form of the remainder in Taylor's theorem. Improper integrals. [6]

Contents

2.1	Sums, products and quotients	4
2.2	Monotone-sequences property	4

1 The real number system

Lemma. Let \mathbb{F} be an ordered field and $x \in \mathbb{F}$. Then $x^2 \geq 0$.

Lemma (Archimedean property v1)). Let \mathbb{F} be an ordered field with the least upper bound property. Then the set $\{1, 2, 3, \dots\}$ is not bounded above. (Note that these need not refer to natural numbers. We simply define 1 to be the multiplicative identity, $2 = 1 + 1$, $3 = 1 + 2$ etc.)

2 Convergence of sequences

Lemma (Archimedean property v2). $1/n \rightarrow 0$.

Lemma. Every eventually bounded sequence is bounded.

2.1 Sums, products and quotients

Lemma (Sums of sequences). If $a_n \rightarrow a$ and $b_n \rightarrow b$, then

$$(i) \quad a_n + b_n \rightarrow a + b$$

Lemma (Scalar multiplication of sequences). Let $a_n \rightarrow a$ and $\lambda \in \mathbb{R}$. Then $\lambda a_n \rightarrow \lambda a$.

Lemma. Let a_n be bounded $b_n \rightarrow 0$. Then $a_n b_n \rightarrow 0$.

Lemma. Every convergent sequence is bounded.

Lemma (Product of sequences). Let $a_n \rightarrow a$ and $b_n \rightarrow b$. Then $a_n b_n \rightarrow ab$.

Lemma (Quotient of sequences). Let (a_n) be a sequence such that $\forall n \neq 0$. Suppose that $a_n \rightarrow a$ and $a \neq 0$. Then $1/a_n \rightarrow 1/a$.

Corollary. If $a_n \rightarrow a, b_n \rightarrow b, b_n, b \neq 0$. Then $a_n/b_n \rightarrow a/b$.

Lemma (Sandwich rule). Let (a_n) and (b_n) be sequences that both converge to a limit x . Suppose that $a_n \leq c_n \leq b_n$ for every n . Then $c_n \rightarrow x$.

2.2 Monotone-sequences property

Lemma. Least upper bound property \Rightarrow monotone-sequences property.

Lemma. Monotone-sequences property. \Rightarrow Archimedean property.

Lemma. Monotone sequences property \Rightarrow least upper bound property.
