# Part IA - Analysis I Definitions

Lectured by W. T. Gowers

Lent 2015

#### Limits and convergence

Sequences and series in R and C. Sums, products and quotients. Absolute convergence; absolute convergence implies convergence. The Bolzano-Weierstrass theorem and applications (the General Principle of Convergence). Comparison and ratio tests, alternating series test.

#### Continuity

Continuity of real- and complex-valued functions defined on subsets of  $\mathbb{R}$  and  $\mathbb{C}$ . The intermediate value theorem. A continuous function on a closed bounded interval is bounded and attains its bounds.

#### Differentiability

Differentiability of functions from  $\mathbb{R}$  to  $\mathbb{R}$ . Derivative of sums and products. The chain rule. Derivative of the inverse function. Rolle's theorem; the mean value theorem. One-dimensional version of the inverse function theorem. Taylor's theorem from  $\mathbb{R}$  to  $\mathbb{R}$ ; Lagranges form of the remainder. Complex differentiation.

#### Power series

Complex power series and radius of convergence. Exponential, trigonometric and hyperbolic functions, and relations between them. \*Direct proof of the differentiability of a power series within its circle of convergence\*.

#### Integration

Definition and basic properties of the Riemann integral. A non-integrable function. Integrability of monotonic functions. Integrability of piecewise-continuous functions. The fundamental theorem of calculus. Differentiation of indefinite integrals. Integration by parts. The integral form of the remainder in Taylor's theorem. Improper integrals. [6]

## 1 The real number system

**Definition** (Field). A *field* is a set X with two binary operations + and  $\times$  that satisfies all the familiar properties satisfied by addition and multiplication in  $\mathbb{Q}$ , namely

- Associativity:  $\forall a, b, c \in X$ , a+(b+c)=(a+b)+c and  $a\times(b\times c)=(a\times b)\times c$
- Commutativity:  $\forall a, b \in X, a + b = b + a \text{ and } a \times b = b \times a$
- Identity:  $\exists 0, 1 \in X$  such that  $\forall a, a + 0 = a$  and  $a \times 1 = a$ .
- Inverses:  $\forall a \in X$ ,  $\exists (-a) \in X$  such that a + (-a) = 0. If  $a \neq 0$ , then  $\exists a^{-1}$  such that  $a \times a^{-1} = 1$ .
- Distributivity:  $\forall a, b, c \in F, a \times (b+c) = (a \times b) + (a \times c)$

**Definition** (Totally ordered set). An (totally) ordered set is a set X with a relation < that satisfies

- (i) Transitivity: if  $x, y, z \in X$ , x < y and y < z, then x < z
- (ii) Trichotomy: if  $x, y \in X$ , exactly one of x < y, x = y, y < x holds

**Definition** (Ordered field). An *ordered field* is a field  $\mathbb{F}$  with a relation < that makes  $\mathbb{F}$  into an ordered set such that

- (i) if  $x, y, z \in \mathbb{F}$  and x < y, then x + z < y + z
- (ii) if  $x, y, z \in \mathbb{F}$ , x < y and z > 0, then xz < yz

**Definition** (Least upper bound). Let X be an ordered set and let  $A \subseteq X$ . An upper bound for A is an element  $x \in X$  such that  $\forall a \in A (a \leq x)$ . If A has an upper bound, then we say that A is bounded above.

An upper bound x for A is a *least upper bound* or *supremum* if nothing smaller that x is an upper bound. That is, we need

- (i)  $\forall a \in A (a \le x)$
- (ii)  $\forall y < x(\exists a \in A(a \ge y))$

We usually write  $\sup A$  for the supremum of A when it exists. If  $\sup A \in A$ , then we call it  $\max A$ , the maximum of A.

**Definition** (Least upper bound property). An ordered field has the *least upper bound property* if every non-empty subset of  $\mathbb{F}$  that is bounded above has a supremum.

## 2 Convergence of sequences

**Definition** (Sequence). A sequence is, formally, a function  $a : \mathbb{N} \to \mathbb{R}$  (or  $\mathbb{C}$ ). Usually (i.e. always), we write  $a_n$  instead of a(n). Instead of  $a, (a_n), (a_n)_1^{\infty}$  or  $(a_n)_{n=1}^{\infty}$  to indicate it is a sequence.

**Definition** (Convergence of sequence). Let  $(a_n)$  be a sequence and  $\ell \in \mathbb{R}$ . Then  $a_n$  converges to  $\ell$ , tends to  $\ell$ , or  $a_n \to \ell$ , if

$$\forall \varepsilon > 0 \ \exists N \ \forall n \ge N : \ |a_n - \ell| < \varepsilon.$$

**Definition** (Bounded sequence). A sequence  $(a_n)$  is bounded

$$\exists C \ \forall n: \ |a_n| \leq C.$$

A sequnece is eventually bounded if

$$\exists C \ \exists N \ \forall n \ge N : \ |a_n| \le C.$$

### 2.1 Sums, products and quotients
